

DREAM JOB

My dream job has always been web development because I enjoy creating things and technology. I've always liked playing around with computers, learning different coding languages, and making basic webpages. As I grew older, I understood that web development would be a great way for me to combine my creativity, problem-solving, and technological interests.

My main duty as a web developer is to design, develop, and enhance websites. This includes creating the website's design and navigation, coding it with HTML, CSS, and JavaScript, testing it, repairing any errors, and putting it live. In addition, I have to research new software, write effective code, build APIs, produce documentation, and put backup plans in place in case the website breaks down. Since I'll be collaborating with business partners to create and distribute content on time, communication is essential.

I need to learn fundamental programming languages like HTML, CSS, and JavaScript as well as frameworks like React or Angular if I want to be a successful web developer. To demonstrate my abilities in building mobile-friendly and responsive websites, I had to put together a portfolio. My basic knowledge will come from completing web development training or earning a degree in computer science. To prove my knowledge, I can also obtain certifications in particular languages and frameworks. I am confident that I can succeed as a web developer if I am committed to lifelong learning and skill development.

If I put in the effort to gain experience and acquire web development skills, I think I can land my dream job. I knew that if I worked hard and was passionate about technology and coding, I could make a fulfilling career out of being a web developer. I can continuously push myself at work by using my creativity, problem-solving skills, and output to create something valuable. For me, web development is the ideal way to combine my innate skills and passions.
